Collective Excitations in the Antisymmetric Channel of Raman Spectroscopy Hsiang-Hsi Kung, 2021-12-08 This thesis contains three breakthrough results in condensed matter physics Firstly broken reflection symmetry in the hidden order phase of the heavy fermion material URu₂Si₂ is observed for the first time This represents a significant advance in the understanding of this enigmatic material which has long intrigued the condensed matter community due to its emergent long range order exhibited at low temperatures the so called hidden order Secondly and thirdly a novel collective mode the chiral spin wave and a novel composite particle the chiral exciton are discovered in the three dimensional topological insulator Bi₂Se₃ This opens up new avenues of possibility for the use of topological insulators in photonic optoelectronic and spintronic devices These discoveries are facilitated by using low temperature polarized Raman spectroscopy as a tool for identifying optically excited collective modes in strongly correlated electron systems and three dimensional topological insulators *Poor's Manual of Industrials*, 1910 **Accurate Calibration of Raman Systems** Magnus

Schlösser, 2014-05-05 Neutrinos can arguably be labeled as the most fascinating elementary particles known as their small but non zero rest mass points to new mass generating mechanisms beyond the Standard Model and also assigns primordial neutrinos from the Big Bang a distinct role in shaping the evolution of large scale structures in the universe The open question of the absolute neutrino mass scale will be addressed by the Karlsruhe Tritium Neutrino KATRIN experiment currently under construction This thesis reports major contributions to developing and implementing new laser spectroscopic precision tools to continuously monitor the isotope content of the windowless gaseous tritium source of KATRIN The method of choice Raman spectroscopy is ideally suited for in situ monitoring of all six hydrogen isotopologues In a series of beautiful experiments the author obtained two independent novel calibration methods first based on a comparison of experimental Raman depolarization ratios with corresponding quantum chemical calculations and second on a gas sampling technique Both methods yield consistent cross calibration results and as well as yielding improvements in precision will be of major importance in reducing systematic effects in long term neutrino mass measurements The methods developed in this thesis also have great potential to further broaden the applications of Raman spectroscopy to study extended sources such as in atmospheric physics **Handbook of X-ray Imaging** Paolo Russo, 2017-12-14
