

A detailed map of the Everglades region in South Florida. The map shows the extensive Everglades Agricultural Area in the north, followed by the Water Conservation Areas, and the Everglades National Park in the south. Major waterways like the Florida Turnpike, Tamiami Trail, and various canals are depicted. Coastal features like Miami Beach and Fort Lauderdale are also labeled. The map uses different shades of green and brown to delineate these various zones.

Re-Engineering Water Storage in the Everglades National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Water Science and Technology Board, Committee on Restoration of the Greater Everglades Ecosystem, 2005-05-17 The Water Science and Technology Board and the Board on Environmental Studies and Toxicology have released the seventh and final report of the Committee on Restoration of the Greater Everglades Ecosystem which provides consensus advice to the South Florida Ecosystem Restoration Task Force on various scientific and technical topics Human settlements and flood control structures have significantly reduced the Everglades which once encompassed over three million acres of slow moving water enriched by a diverse biota To remedy the degradation of the Everglades a comprehensive Everglades Restoration Plan was formulated in 1999 with the goal of restoring the original hydrologic conditions of its remaining natural ecosystem A major feature of this plan is providing enough storage capacity to meet human needs while also providing the needs of the greater Everglades ecosystem This report reviews and evaluates not only storage options included in the Restoration Plan but also other options not considered in the Plan Along with providing hydrologic and ecological analyses of the size location and functioning of water storage components the report also discusses and makes recommendations on related critical factors such as timing of land acquisition intermediate states of restoration and tradeoffs among competing goals and ecosystem objectives *Progress Toward Restoring the Everglades* National Research Council, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Water Science and Technology Board, Committee on Independent Scientific Review of Everglades Restoration Progress, 2013-02-04 Twelve years into the Comprehensive Everglades Restoration Project little progress has been made in restoring the core of the remaining Everglades ecosystem instead most project construction so far has occurred along its periphery To reverse ongoing ecosystem declines it will be necessary to expedite restoration projects that target the central Everglades and to improve both the quality and quantity of the water in the ecosystem The new Central Everglades Planning Project offers an innovative approach to this challenge although additional analyses are needed at the interface of water quality and water quantity to maximize restoration benefits within existing legal constraints *Progress Toward Restoring the Everglades* The Fourth Biennial Review 2012 explains the innovative approach to expedite restoration progress and additional rigorous analyses at the interface of water quality and quantity will be essential to maximize restoration benefits *Progress Toward Restoring the Everglades* National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Board on Environmental Studies and Toxicology, Water Science and Technology Board, Committee on Independent Scientific Review of Everglades Restoration Progress, 2017-04-07 The Everglades ecosystem is vast stretching more than 200 miles from Orlando to Florida Bay and Everglades National Park is but a part located at the southern end During the 19th and 20th centuries the historical Everglades has been reduced to half of its original size and what remains is not the pristine ecosystem many image

it to be but one that has been highly engineered and otherwise heavily influenced and is intensely managed by humans Rather than slowly flowing southward in a broad river of grass water moves through a maze of canals levees pump stations and hydraulic control structures and a substantial fraction is diverted from the natural system to meet water supply and flood control needs The water that remains is polluted by phosphorus and other contaminants originating from agriculture and other human activities Many components of the natural system are highly degraded and continue to degrade Progress Toward Restoring the Everglades is the sixth biennial review of progress made in meeting the goals of the Comprehensive Everglades Restoration Plan CERP This complex multibillion dollar project to protect and restore the remaining Everglades has a 30 40 year timeline This report assesses progress made in the various separate project components and discusses specific scientific and engineering issues that may impact further progress According to Progress Toward Restoring the Everglades a dedicated source of funding could provide ongoing long term system wide monitoring and assessment that is critical to meeting restoration objectives This report examines the implications of knowledge gained and changes in widely accepted scientific understanding regarding pre drainage hydrology climate change and the feasibility of water storage since the CERP was developed

The Wetlands Handbook, 2 Volume Set Edward Maltby, Tom Barker, 2009-07-23 Forty two chapters by international experts from a wide range of disciplines make The Wetlands Handbook the essential tool for those seeking comprehensive understanding of the subject. A departure from more traditional treatises, this text examines freshwater wetland ecosystem science from the fundamentals to issues of management and policy. Introductory chapters address the scope and significance of wetlands globally for communities, culture and biodiversity. Subsequent sections deal with processes underpinning wetland functioning, how wetlands work, their uses and values for humans and nature, their sensitivity to external impacts and how they may be restored. The text is illustrated by numerous examples emphasising functional and holistic approaches to wetland management, including case studies on the wise use and rehabilitation of wetlands in farmed, urban, industrial and other damaged environments, highlighting the long term benefits of multiple use. The Wetlands Handbook will provide an invaluable reference for researchers, managers, policy makers and students of wetland sciences.

A Review of the Landscape Conservation Cooperatives National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Board on Agriculture and Natural Resources, Board on Atmospheric Sciences and Climate, Committee on the Evaluation of the Landscape Conservation Cooperatives, 2016-11-28. The United States tradition of conserving fish, wildlife, habitats and cultural resources dates to the mid 19th century. States have long sought to manage fish and wildlife species within their borders, whereas many early federal conservation efforts focused on setting aside specific places as parks, sanctuaries or reserves. With advances in landscape ecology over the past quarter century, conservation planners, scientists and practitioners began to stress the importance of conservation efforts at the scale of landscapes and seascapes. These larger areas were thought to harbor relatively large numbers of species that are likely to maintain population viability and sustain ecological processes, and natural disturbance regimes often considered critical factors in conserving biodiversity. By focusing conservation efforts at the level of whole ecosystems and landscape, practitioners can better attempt to conserve the vast majority of species in a particular ecosystem. Successfully addressing the large scale, interlinked problems associated with landscape degradation will necessitate a planning process that bridges different scientific disciplines and across sectors, as well as an understanding of complexity, uncertainty and the local context of conservation work. The landscape approach aims to develop shared conservation priorities across jurisdictions and across many resources to create a single collaborative conservation effort that can meet stakeholder needs. Conservation of habitats, species, ecosystem services and cultural resources in the face of multiple stressors requires governance structures that can bridge the geographic and jurisdictional boundaries of the complex socio-ecological systems in which landscape level conservation occurs. The Landscape Conservation Cooperatives (LCC) Network was established to complement and add value to the many ongoing state, tribal, federal and nongovernmental efforts to address the challenge of conserving species, habitats, ecosystem services and cultural resources in the face of large scale and long term threats, including climate change. A Review

of the Landscape Conservation Cooperatives evaluates the purpose goals and scientific merits of the LCC program within the context of similar programs and whether the program has resulted in measurable improvements in the health of fish wildlife and their habitats *Hydrology, Ecology, and Fishes of the Klamath River Basin* National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Board on Environmental Studies and Toxicology, Committee on Hydrology, Ecology, and Fishes of the Klamath River, 2008-03-11 The Klamath River basin which spans parts of southern Oregon and northern California has been the focus of a prominent conflict over competing uses for water Management actions to protect threatened and endangered fish species in the basin have left less water available for irrigation in dry years and heightened tensions among farmers and other stakeholders including commercial fishermen Native Americans conservationists hunters anglers and hydropower producers This National Research Council book assesses two recent studies that evaluate various aspects of flows in the Klamath basin 1 the Instream Flow Phase II study IFS conducted by Utah State University and 2 the Natural Flow of the Upper Klamath Basin study NFS conducted by the U S Bureau of Reclamation USBR The book concludes that both studies offer important new information but do not provide enough information for detailed management of flows in the Klamath River and it offers many suggestions for improving the studies The report recommends that a comprehensive analysis of the many individual studies of the Klamath river basin be conducted so that a big picture perspective of the entire basin and research and management needs can emerge **Broward County Water Preserve Areas Project** United States.
