Reactions Of Coordinated Ligands And Homogeneous Catalysis:

Aspects of Homogeneous Catalysis R. Ugo, 2012-12-06 In recent years the liquid phase oxidation of organic substrates using transition metal compounds as catalysts has become a profitable means of obtaining industrially important chemicals Millions of tons of valuable petrochemicals are produced in this manner annually 1 Typical examples of such processes are the production of vinyl acetate or acetaldehyde via the Wacker process equations 1 and 2 the Mid Century process for the oxidation of methyl aromatics such as p xylene to terephthalic acid equation 3 and the production of propylene oxide from propylene using alkyl hydroperoxides equation 4 $\text{PdCl}_2 \cdot \text{CuCl}_2$ $\text{CH}_2=\text{CH}_2 + \text{O}_2 \rightarrow \text{H}_2\text{O} + \text{CH}_3\text{CHO}$ $\text{Co}(\text{OAc})_2$ 3 4 The vast majority of liquid phase transition metal catalyzed oxidations of organic compounds fall into these three broad categories a free radical autoxidation reactions b reactions involving nucleophilic attack on coordinated substrate such as the Wacker process or c metal catalyzed reactions of organic substrates with hydroperoxides Of these three classes of oxidations only the first represents the actual interaction of dioxygen with an organic substrate The function of oxygen in the Wacker process is simply to re oxidize the catalyst after each cycle 2

REACTIONS OF COORDINATED LIGANDS AND HOMOGENEOUS

CATALYSIS- SYMPOSIUM OF THE DIVISION OF INORGANIC CHEMISTRY AT THE 141ST MEETING- ACS. ,

Synthetic Coordination Chemistry Julian A. Davies, 1996 Although coordination chemistry naturally centers on the synthesis of coordination compounds the synthesis of these materials is typically not an end in itself Coordination compounds are utilized in all branches of chemistry from theoretical modeling to industrial and consumer products While a large amount of information is available on coordination chemistry in general and synthetic methods in particular no comprehensive work has been presented on the preparation of coordination compounds with an emphasis on synthetic strategies rather than on detailed descriptions of specific syntheses The goal of this book is to provide an approach to coordination chemistry that is based upon preparative strategies The main aim of the authors is to present a systematic classification of synthetic reactions rather than an encyclopedic listing of experimental results Hence the coverage is more selective than exhaustive Despite this the book provides access to the original literature with ca 2000 references The edition is well illustrated and contains almost 250 schemes figures and illustrations of crystal structures of selected complexes

Reactions of Coordinated Ligands

P.S. Braterman, 2011-11-10 This book is aimed at graduate students and research workers in all branches of chemistry who wish to gain insight into what continues to be one of the fastest growing areas of the subject Bonding to a metal center may stabilize a ligand towards some reagents activate it towards others or modify its chemical behavior in more subtle ways All these effects have their uses and all invite understanding in terms of mechanism Thus mechanistic insight is linked to control of reaction pathways The detailed working out of this relationship provides the central theme of the book The effect of the

metal may be electronic or steric and may involve the energy or the entropy of activation. It may depend on changes induced in the initial state of the ligand or on those that only arise further along the reaction pathway. It may involve one coordination site or several and the effects may be more or less specific to the metal involved and more or less amenable to control through the other ligands. These remarks apply equally strongly to the carbon bound ligands which occupy the major part of this work and to those attached by other atoms. Thus the reactions discussed here are relevant in such diverse areas as bulk homogeneous catalysis, stereoselective stoichiometric synthesis and bioinorganic chemistry.

The Privileged Pincer-Metal Platform: Coordination Chemistry & Applications Gerard van Koten, Robert A

Gossage, 2015-08-27 The series Topics in Organometallic Chemistry presents critical overviews of research results in organometallic chemistry. As our understanding of organometallic structure, properties and mechanisms increases, new ways are opened for the design of organometallic compounds and reactions tailored to the needs of such diverse areas as organic synthesis, medical research, biology and materials science. Thus the scope of coverage includes a broad range of topics in pure and applied organometallic chemistry where new breakthroughs are being achieved that are of significance to a larger scientific audience. The individual volumes of Topics in Organometallic Chemistry are thematic. Review articles are generally invited by the volume editors.

Organometallic Chemistry and Catalysis Karl Kirchner, Walter Weissensteiner, 2012-12-06

From the beginning of chemistry as an exact natural science almost 200 years ago there was a more or less distinct differentiation between its various branches such as organic, inorganic, physical, analytical or biochemistry. With the increasing insight into the connections and governing laws it soon became obvious, however, that such a clear separation could be regarded as more or less obsolete within almost any field of chemical research. One has to deal with most of the branches mentioned. Especially organic and inorganic chemistry are significant examples for this statement, overlapping considerably within the important field of organometallic chemistry. This regime of chemistry started its advance with the discovery of dimethylzinc 150 years ago, had a highlight with the introduction of Grignard reagents around 1900, developed further with the start of lithium organyls in 1925 and literally exploded after the discovery of the first transition metal cyclopentadienyl complex, ferrocene, half a century ago. The chronological sequence of the important steps, i.e. 1850 Zn, 1900 Mg, 1925 Li, 1950 Fe, seems rather remarkable. The increasing group of metallocenes is not only of high theoretical and due to the potential chirality of its members, stereochemical interest, but offers also a wide variety of extremely useful catalysts, especially for stereoselective reactions. The Austrian Chemical Society took this development into account by organizing the Twelfth International Conference on Organometallic Chemistry held in Vienna in 1985.
