Distributed Artificial Intelligence for 5G/6G Communications Iacovos Ioannou,Prabagarane Nagaradjane,Vasos Vassiliou,Andreas Pitsillides,Christophoros Christophorou,2024-12-24 The aim of this book is to delineate the challenges faced by new generation mobile networks such as 5G and forthcoming 6G and introduce the concept of addressing these challenges through the development of a novel Distributed AI DAI framework The book proposes a distributed AI approach to handle these complexities effectively Distributed Artificial Intelligence for 5G 6G Communications Frameworks with Machine Learning aims to provide a comprehensive understanding of the proposed DAI framework its architecture implementation and application in the context of D2D communication in 5G and beyond networks It showcases how the framework can enhance decision making control and communication performance while considering both static and dynamic network environments The book delves into the advantages of D2D communication highlighting how it transcends licensed frequency bands and bypasses the cellular network leading to improved network metrics such as spectral efficiency energy efficiency data rates and interference management It concludes by emphasizing that the DAI framework can offer enhanced network control reduced signaling overhead and efficient decision making while capitalizing on existing implementations to tackle various challenges across the 5G and 6G landscape This book is intended for professionals that specialize in designing implementing and maintaining communication networks such as telecommunications communication engineers wireless engineers The book s emphasis on incorporating AI and ML techniques in the proposed framework also makes it of interest to computer and software engineers working in artificial intelligence and machine learning engineers

Artificial Cognitive Architecture with Self-Learning and Self-Optimization Capabilities Gerardo Beruvides,2018-12-14 This book introduces three key issues i development of a gradient free method to enable multi objective self optimization ii development of a reinforcement learning strategy to carry out self learning and finally iii experimental evaluation and validation in two micromachining processes i e micro milling and micro drilling The computational architecture modular network and reconfigurable for real time monitoring and control takes into account the analysis of different types of sensors processing strategies and methodologies for extracting behavior patterns from representative process signals The reconfiguration capability and portability of this architecture are supported by two major levels the cognitive level core and the executive level direct data exchange with the process At the same time the architecture includes different operating modes that interact with the process to be monitored and or controlled The cognitive level includes three fundamental modes such as modeling optimization and learning which are necessary for

decision making in the form of control signals and for the real time experimental characterization of complex processes In the specific case of the micromachining processes a series of models based on linear regression nonlinear regression and artificial intelligence techniques were obtained On the other hand the executive level has a constant interaction with the process to be monitored and or controlled This level receives the configuration and parameterization from the cognitive level to perform the desired monitoring and control tasks
