Reservoir Stimulation

Michael J. Economides, 1987 More than 13 years ago the first edition of Reservoir Stimulation was published The second edition followed in 1989 and contained substantial additions updates and two new chapters Planning for the third edition began in October 1994 in response to the demand for an updated version of the book This new edition has been completely rewritten to reflect the changing technologies in the industry and contains 20 chapters written by 44 authors It continues to provide an overview of reservoir stimulation from an all encompassing engineering standpoint an overview currently unavailable elsewhere Reservoir Stimulation sets forth a rationalisation of stimulation using reservoir engineering concepts and addresses topics such as formation characterisation hydraulic fracturing and matrix acidizing Formation damage which refers to a loss in reservoir productivity is also examined comprehensively This extensive reference work remains essential reading for petroleum industry professionals involved in the important activities of reservoir evaluation development and management who require invaluable skills in the application of the techniques described for the successful exploitation of oil and gas reservoirs Contributors to this volume are among the most recognized authorities in their individual technologies The editors are grateful for their participation and thank clients academic institutions and other organizations for supporting the completion of this text

Development of coupled THM models for reservoir stimulation and geo-energy production with supercritical CO2 as working fluid Jianxing Liao, 2020-07-28 In this dissertation two specific numerical models have been developed to address the issues associated with utilization of supercritical CO2 like fracture creation proppant placement and fracture closure in unconventional gas reservoirs reservoir stimulation heat production and CO2 sequestration in deep geothermal reservoirs respectively In unconventional gas reservoir the model consisting of classic fracture model proppant transport model as well as temperature sensitive fracturing fluids CO2 thickened CO2 and guar gum has been integrated into the popular THM coupled framework TOUGH2MP FLAC3D which has the ability to simulate single fracture propagation driven by different fracturing fluids in non isothermal condition To characterize the fracture network propagation and internal multi fluids behavior in deep geothermal reservoirs an anisotropic permeability model on the foundation of the continuum anisotropic damage model has been developed and integrated into the popular THM coupled framework TOUGH2MP FLAC3D as well This model has the potential to simulate the reservoir stimulation and heat extraction based on a CO2 EGS concept

Well Completion Design Jonathan Bellarby, 2009-04-13 Completions are the conduit between hydrocarbon reservoirs and surface facilities They are a fundamental part of any hydrocarbon field development project They have to be designed for safely maximising the hydrocarbon recovery from the well and may have to last for many years under ever changing conditions Issues include connection with the reservoir rock avoiding sand production selecting the correct interval pumps and other forms of artificial lift safety and integrity equipment selection and

installation and future well interventions Course book based on course well completion design by TRACS International
 Unique in its field Coverage of offshore subsea and landbased completions in all of the major hydrocarbon basins of the world

Numerical study of the stimulation related thermo-hydro-mechanical processes in tight gas and deep geothermal reservoirs Wentao Feng, 2020-03-05 Hydraulic fracturing in combination with horizontal well is playing a key role in the efficient development of unconventional gas oil reservoirs and deep geothermal resources However the integral operation especially from the perspective of THM Thermal Hydraulic Mechanic interactions have not been studied systematically In this thesis targeted improvements were achieved through developing a series of mathematical physical models and their implementation into the existing numerical tools FLAC3Dplus and TOUGH2MP FLAC3D including a a new thermal module for FLAC3Dplus based entirely on the finite volume method FVM which is especially developed for the fracturing process and can also achieve the modeling of gel breaking b a rock damage module of TOUGH2MP FLAC3D which also considers the impacts of rock damaging process on evolution of permeability c an in depth improved FLAC3Dplus simulator that obtains the ability to simulate a 3D fracture propagation with arbitrary orientation After the corresponding verifications the improved tools were applied in different case studies to reveal a influences of the fluid s viscosity on the fracturing results in tight sandstone reservoirs b the induced seismicity during the fracturing operation and the reactivation of the natural faults and c the fracture propagation with arbitrary orientation
