Property Testing Current Research And Surveys Lecture Notes In Computer Science:

Introduction to Property Testing Oded Goldreich, 2017-11-23 Property testing is concerned with the design of super fast algorithms for the structural analysis of large quantities of data The aim is to unveil global features of the data such as determining whether the data has a particular property or estimating global parameters Remarkably it is possible for decisions to be made by accessing only a small portion of the data Property testing focuses on properties and parameters that go beyond simple statistics This book provides an extensive and authoritative introduction to property testing It provides a wide range of algorithmic techniques for the design and analysis of tests for algebraic properties properties of Boolean functions graph properties and properties of distributions *SOFSEM 2025: Theory and Practice of Computer Science* Rastislav Kráľovič, Věra Kůrková, 2025-02-15 This book constitutes the proceedings of the 50th International Conference on Current Trends in Theory and Practice of Computer Science SOFSEM 2025 held in Bratislava Slovak Republic during January 20 23 2025 The 48 full papers presented in this book were carefully reviewed and selected from 109 submissions They include original research from all areas of foundations of computer science and artificial intelligence focusing on AI based algorithms and techniques nature inspired computing machine learning theory multi agent algorithms and games neural network theory parallel and distributed computing quantum computing computability decidability classical and non classical models of computation computational complexity computational learning cryptographic techniques and security data compression data and pattern mining methods discrete combinatorial optimization automata languages machine models rewriting systems efficient data structures graph structure and algorithms logics of computation robotics and other relevant theory topics in computing and AI **Algorithms and Complexity** Marios Mavronicolas, 2023-04-24 This book constitutes the refereed proceedings of the 13th International Conference on Algorithms and Complexity CIAC 2023 which took place in Larnaca Cyprus during June 13 16 2023 The 25 full papers included in this book were carefully reviewed and selected from 49 submissions They cover all important areas of research on algorithms and complexity such as algorithm design and analysis sequential parallel and distributed algorithms data structures computational and structural complexity lower bounds and limitations of algorithms randomized and approximation algorithms parameterized algorithms and parameterized complexity classes smoothed analysis of algorithms alternatives to the worst case analysis of algorithms e g algorithms with predictions on line computation and competitive analysis streaming algorithms quantum algorithms and complexity algorithms in algebra geometry number theory and combinatorics computational geometry algorithmic game theory and mechanism design algorithmic economics including auctions and contests computational learning theory computational biology and bioinformatics algorithmic issues in communication networks algorithms for discrete optimization including convex optimization and algorithm engineering *Number Theory and Related Fields* Jonathan M. the International Number Theory Conference in Memory of Alf van der Poorten hosted by CARMA and held March 12-16th 2012 at the University of Newcastle Australia. The purpose of the conference was to promote number theory research in Australia while commemorating the legacy of Alf van der Poorten who had written over 170 papers on the topic of number theory and collaborated with dozens of researchers. The research articles and surveys presented in this book were written by some of the most distinguished mathematicians in the field of number theory and articles will include related topics that focus on the various research interests of Dr van der Poorten.

Surveys in Combinatorics 2019 Allan Lo, Richard Mycroft, Guillem Perarnau, Andrew Treglown, 2019-06-27. Eight articles provide a valuable survey of the present state of knowledge in combinatorics.

Forbidden Configurations in Discrete Geometry David Eppstein, 2018-05-17. Unifies discrete and computational geometry by using forbidden patterns of points to characterize many of its problems.

Hardness of Approximation Between P and NP Aviad Rubinfeld, 2019-06-07. Nash equilibrium is the central solution concept in Game Theory. Since Nash's original paper in 1951, it has found countless applications in modeling strategic behavior of traders in markets, human drivers and electronic routers in congested networks, nations in nuclear disarmament negotiations and more. A decade ago, the relevance of this solution concept was called into question by computer scientists who proved, under appropriate complexity assumptions, that computing a Nash equilibrium is an intractable problem. And if centralized, specially designed algorithms cannot find Nash equilibria, why should we expect distributed selfish agents to converge to one? The remaining hope was that at least approximate Nash equilibria can be efficiently computed. Understanding whether there is an efficient algorithm for approximate Nash equilibrium has been the central open problem in this field for the past decade. In this book, we provide strong evidence that even finding an approximate Nash equilibrium is intractable. We prove several intractability theorems for different settings: two player games and many player games and models, computational complexity, query complexity and communication complexity. In particular, our main result is that under a plausible and natural complexity assumption, Exponential Time Hypothesis for PPAD, there is no polynomial time algorithm for finding an approximate Nash equilibrium in two player games. The problem of approximate Nash equilibrium in a two player game poses a unique technical challenge: it is a member of the class PPAD, which captures the complexity of several fundamental total problems, i.e. problems that always have a solution, and it also admits a quasipolynomial time algorithm. Either property alone is believed to place this problem far below NP-hard problems in the complexity hierarchy, having both simultaneously places it just above P, at what can be called the frontier of intractability. Indeed, the tools we develop in this book to advance on this frontier are useful for proving hardness of approximation of several other important problems whose complexity lies between P and NP: Brouwer's fixed point, market equilibrium, CourseMatch, A CEEI, densest k-subgraph, community detection, VC dimension and Littlestone dimension, and signaling in zero-sum games.
