Decarbonizing Power Generation Sectors Using Biomass and Hydrogen-Based Fuels Arif Darmawan, Eniya Listiani Dewi, Hariana Hariana, Muhammad Aziz, 2025-01-31
This book presents a comprehensive overview of important issues and topics concerning the combustion and cofiring of biomass and hydrogen based fuels such as ammonia in the power generation sector. In recent years the energy sector has been responsible for around three quarters of global greenhouse gas (GHG) emissions. Cofiring of coal with agricultural and forestry wastes and low emissions hydrogen and ammonia could reduce GHG emissions from power plants and may offer a cheaper option to achieve Net Zero Emissions (NZE). This book provides an updated review of combustion and co combustion technologies especially for ammonia and hydrogen cofiring which includes technical issues, emission reduction and by-product problems. It goes into an in-depth discussion of hydrogen and ammonia exclusive combustion for power generation to reduce CO₂ emissions. The content caters to students, academic and industry researchers and policymakers who are interested in decarbonizing power generation sectors using biomass and hydrogen based fuels.

Handbook of Software Solutions for ICME Georg J. Schmitz, Ulrich Prahl, 2016-10-31
As one of the results of an ambitious project, this handbook provides a well-structured directory of globally available software tools in the area of Integrated Computational Materials Engineering (ICME). The compilation covers models, software tools and numerical methods allowing describing electronic, atomistic and mesoscopic phenomena which in their combination determine the microstructure and the properties of materials. It reaches out to simulations of component manufacture comprising primary shaping, forming, joining, coating, heat treatment and machining processes. Models and tools addressing the in-service behavior like fatigue, corrosion and eventually recycling complete the compilation. An introductory overview is provided for each of these different modelling areas, highlighting the relevant phenomena and also discussing the current state for the different simulation approaches. A must-have for researchers, application engineers and simulation software providers seeking a holistic overview about the current state of the art in a huge variety of modelling topics. This handbook equally serves as a reference manual for academic and commercial software developers and providers for industrial users of simulation software and for decision makers seeking to optimize their production by simulations. In view of its sound introductions into the different fields of materials physics, materials chemistry, materials engineering and materials processing, it also serves as a tutorial for students in the emerging discipline of ICME which requires a broad view on things and at least a basic education in adjacent fields.

in combination with electrical components or on its own attention will need to be paid to continue improving its efficiency in the future. The high development depth of today's combustion engines means that it is becoming increasingly difficult to achieve significant efficiency improvements by simple means. On the search for these improvements, the focus has shifted to inner engine processes for instance charge cycles including the charging system, the mixture formation including injection, combustion and kinematic conversion of the energy within the fuel. Our 2nd conference Engine processes aims to offer all developers a platform to discuss the latest technological developments in the field of inner engine process control and encourage new paths to be taken. We believe that the program for this conference is a sound foundation for this endeavour.

Da der Verbrennungsmotor auch mittelfristig die dominierende Energiewandlungseinheit im Antriebsstrang von Kraftfahrzeugen sein wird, entweder im Verbund mit elektrischen Komponenten oder aber als alleiniger Antrieb, muss der Verbesserung von dessen Wirkungsgrad auch in Zukunft erhebliche Aufmerksamkeit zu Teil werden. Aufgrund der hohen Entwicklungstiefe, die heutige Verbrennungsmotoren aufweisen, wird es immer schwerer, deutliche Wirkungsgradverbesserungen auf einfachem Weg zu erreichen. Auf der Suche nach diesen Verbesserungen rücken die innermotorischen Prozesse immer mehr in den Fokus. Hierzu zählen der Ladungswechsel inkl. Aufladesystem, die Gemischbildung inkl. Einspritzung, die Verbrennung sowie die kinematische Wandlung der im Kraftstoff gebundenen Energie. Unsere 2. Tagung Motorische Prozesse soll nun allen Entwicklern als Austauschforum zu neuesten technologischen Entwicklungen auf dem Gebiet der innermotorischen Prozessführung dienen und dazu anregen, neue Wege zu beschreiten. Wir sind überzeugt, mit dem vorliegenden Tagungsprogramm hierzu einen sehr guten Beitrag leisten zu können.
