Read-Out and Coherent Manipulation of an Isolated Nuclear Spin Stefan Thiele, 2015-11-26 This thesis sheds new light on the worldwide first electrical manipulation of a single nuclear spin Over the last four decades the size of a bit the smallest logical unit in a computer has decreased by more than two orders of magnitude and will soon reach a limit where quantum phenomena become important Inspired by the power of quantum mechanics researchers have already identified pure quantum systems having analog to a classical bit two controllable and readable states In this regard the inherent spin of electrons or nuclei with its two eigenstates spin up and spin down is a promising candidate Using expertise in the field of single molecule magnets the author developed a molecular transistor which allows quantum information to be written onto a single nuclear spin by means of an electric field only and in addition enables the electronic read out of this quantum state This novel approach opens a path to addressing and manipulating individual nuclear spins within a very confined space a single molecule at high speed Thus the author was able to show that single molecule magnets are promising candidates for quantum information processing which is triggering a new field of research towards molecular quantum electronics

Basic Principles of Nanotechnology Wesley Sanders, 2018-07-11 The book allows the reader to have a basic understanding of the structure and properties of nanoscale materials routinely used in nanotechnology based research and industries To add the book describes the operation of nanoscale transistors and the processes used to fabricate the devices Additionally it presents research involving the use of carbon nanotubes graphene and molecules to create non silicon based electronic devices It aims to provide an understanding of the operation of the most frequently used fabrication and characterization procedures such as scanning electron microscopy atomic force microscopy etch e beam lithography and photolithography Provides explanations of the common techniques used in nanofabrication Focuses on nanomaterials that are almost exclusively used in academic research and incorporated in consumer materials such as carbon nanotubes graphene metal nanoparticles quantum dots and conductive polymers Each chapter begins with a list of key objectives describing major content covered Includes end of chapter questions to reinforce chapter content
