Mixed-Integer Representations in Control Design Ionela Prodan, Florin Stoican, Sorin Olaru, Silviu-Iulian Niculescu, 2015-11-25 In this book the authors propose efficient characterizations of the non convex regions that appear in many control problems such as those involving collision obstacle avoidance and in a broader sense in the description of feasible sets for optimization based control design involving contradictory objectives The text deals with a large class of systems that require the solution of appropriate optimization problems over a feasible region which is neither convex nor compact The proposed approach uses the combinatorial notion of hyperplane arrangement partitioning the space by a finite collection of hyperplanes to describe non convex regions efficiently Mixed integer programming techniques are then applied to propose acceptable formulations of the overall problem Multiple constructions may arise from the same initial problem and their complexity under various parameters space dimension number of binary variables etc is also discussed This book is a useful tool for academic researchers and graduate students interested in non convex systems working in control engineering area mobile robotics and or optimal planning and decision making

Optimal Design of Multi-Phase Materials Juan Casado-Díaz, 2022-03-31 This book aims the optimal design of a material thermic or electrical obtained as the mixture of a finite number of original materials not necessarily isotropic The problem is to place these materials in such a way that the solution of the corresponding state equation minimizes a certain functional that can depend nonlinearly on the gradient of the state function This is the main novelty in the book It is well known that this type of problems has no solution in general and therefore that it is needed to work with a relaxed formulation The main results in the book refer to how to obtain such formulation the optimality conditions and the numerical computation of the solutions In the case of functionals that do not depend on the gradient of the state equation it is known that a relaxed formulation consists of replacing the original materials with more general materials obtained via homogenization This includes materials with different properties of the originals but whose behavior can be approximated by microscopic mixtures of them In the case of a cost functional depending nonlinearly on the gradient it is also necessary to extend the cost functional to the set of these more general materials In general we do not dispose of an explicit representation and then to numerically solve the problem it is necessary to design strategies that allow the functional to be replaced by upper or lower approximations The book is divided in four chapters The first is devoted to recalling some classical results related to the homogenization of a sequence of linear elliptic partial differential problems In the second one we define the control problem that we are mainly interested in solving in the book We obtain a relaxed formulation and their main properties including an explicit representation of the new cost functional at least in the boundary of its domain In the third chapter we study the optimality conditions of the relaxed problem and we describe some algorithms to numerically solve the problem We also provide some numerical experiments carried out using such algorithms Finally the fourth chapter is devoted to briefly describe some extensions of the results

obtained in Chapters 2 and 3 to the case of dealing with several state equations and the case of evolutive problems The problems covered in the book are interesting for mathematicians and engineers whose work is related to mathematical modeling and the numerical resolution of optimal design problems in material sciences The contents extend some previous results obtained by the author in collaboration with other colleagues Recent Advances in PDEs: Analysis, Numerics and Control Anna Doubova,Manuel González-Burgos,Francisco Guillén-González,Mercedes Marín Beltrán,2018-11-02 This book contains the main results of the talks given at the workshop Recent Advances in PDEs Analysis Numerics and Control which took place in Sevilla Spain on January 25 27 2017 The work comprises 12 contributions given by high level researchers in the partial differential equation PDE area to celebrate the 60th anniversary of Enrique Fernández Cara University of Sevilla The main topics covered here are Control and inverse problems Analysis of Fluid mechanics and Numerical Analysis The work is devoted to researchers in these fields **Achievements and Trends in Material Forming** Gabriela Vincze,Frédéric Barlat,2022-07-22 Peer reviewed extended papers selected from the 25th International Conference on Material Forming ESAFORM 2022 Peer reviewed extended papers selected from the 25th International Conference on Material Forming ESAFORM 2022 April 27 29 2022 Portugal Optimizing Constrained Control Using Mixed Integer Programming Heinz Peter Rothwangl,2001 **A Branch-and-Bound Approach to Mixed-Integer Optimal Control Using POD** Freya Bachmann,2017
