Model Based Engineering Of Embedded Systems The Spes 2020 Methodology:

Model-Based Engineering of Embedded Systems Klaus Pohl, Harald Hönniger, Reinhold Achatz, Manfred Broy, 2012-11-08

Embedded systems have long become essential in application areas in which human control is impossible or infeasible. The development of modern embedded systems is becoming increasingly difficult and challenging because of their overall system complexity, their tighter and cross functional integration, the increasing requirements concerning safety and real time behavior, and the need to reduce development and operation costs. This book provides a comprehensive overview of the Software Platform Embedded Systems SPES modeling framework and demonstrates its applicability in embedded system development in various industry domains such as automation, automotive, avionics, energy, and healthcare. In SPES 2020, twenty-one partners from academia and industry have joined forces in order to develop and evaluate in different industrial domains a modeling framework that reflects the current state of the art in embedded systems engineering. The content of this book is structured in four parts: Part I Starting Point discusses the status quo of embedded systems development and model based engineering and summarizes the key requirements faced when developing embedded systems in different application domains; Part II The SPES Modeling Framework describes the SPES modeling framework; Part III Application and Evaluation of the SPES Modeling Framework reports on the validation steps taken to ensure that the framework met the requirements discussed in Part I; Finally, Part IV Impact of the SPES Modeling Framework summarizes the results achieved and provides an outlook on future work. The book is mainly aimed at professionals and practitioners who deal with the development of embedded systems on a daily basis. Researchers in academia and industry may use it as a compendium for the requirements and state of the art solution concepts for embedded systems development.

Advanced Model-Based Engineering of Embedded Systems Klaus Pohl, Manfred Broy, Heinrich Daembkes, Harald Hönniger, 2016-11-29 This book provides a comprehensive introduction into the SPES XT modeling framework. Moreover, it shows the applicability of the framework for the development of embedded systems in different industry domains and reports on the lessons learned. It also describes how the SPES XT modeling framework can be tailored to meet domain and project specific needs. The book is structured into four parts: Part I Starting Situation discusses the status quo of the development of embedded systems with specific focus on model based engineering and summarizes key challenges emerging from industrial practice; Part II Modeling Theory introduces the SPES XT modeling framework and explains the core underlying principles; Part III Application of the SPES XT Framework describes the application of the SPES XT modeling framework and how it addresses major industrial challenges; Part IV Evaluation and Technology Transfer assesses the impact of the SPES XT modeling framework and includes various exemplary applications from automation, automotive, and avionics. Overall, the SPES XT modeling framework offers a seamless model based engineering approach. It addresses core challenges faced during the engineering of embedded systems. Among others, it offers aligned and integrated techniques for the early validation of engineering artefacts including requirements and

functional and technical designs the management of product variants and their variability modular safety assurance and deployment of embedded software

Model-Based Engineering of Collaborative Embedded Systems Wolfgang Böhm, Manfred Broy, Cornel Klein, Klaus Pohl, Bernhard Rumpe, Sebastian Schröck, 2020-12-14 This Open Access book presents the results of the Collaborative Embedded Systems CrESt project aimed at adapting and complementing the methodology underlying modeling techniques developed to cope with the challenges of the dynamic structures of collaborative embedded systems CESs based on the SPES development methodology In order to manage the high complexity of the individual systems and the dynamically formed interaction structures at runtime advanced and powerful development methods are required that extend the current state of the art in the development of embedded systems and cyber physical systems The methodological contributions of the project support the effective and efficient development of CESs in dynamic and uncertain contexts with special emphasis on the reliability and variability of individual systems and the creation of networks of such systems at runtime The project was funded by the German Federal Ministry of Education and Research BMBF and the case studies are therefore selected from areas that are highly relevant for Germany's economy automotive industrial production power generation and robotics It also supports the digitalization of complex and transformable industrial plants in the context of the German government's Industry 4.0 initiative and the project results provide a solid foundation for implementing the German government's high tech strategy Innovations for Germany in the coming years

Furrer, 2022-07-20 Cyber physical systems CPSs consist of software controlled computing devices communicating with each other and interacting with the physical world through sensors and actuators Because most of the functionality of a CPS is implemented in software the software is of crucial importance for the safety and security of the CPS This book presents principle based engineering for the development and operation of dependable software The knowledge in this book addresses organizations that want to strengthen their methodologies to build safe and secure software for mission critical cyber physical systems The book Presents a successful strategy for the management of vulnerabilities threats and failures in mission critical cyber physical systems Offers deep practical insight into principle based software development 62 principles are introduced and cataloged into five categories Business Provides direct guidance on architecting and operating dependable cyber physical systems for software managers and architects

Engineering Trustworthy Software Systems Zhiming Liu, Zili Zhang, 2016-02-29 This volume contains the lecture notes of the five courses and one seminar given at the School on Engineering Trustworthy Software Systems SETSS 2014 held in September 2014 at Southwest University in Chongqing China The material is useful for postgraduate students researchers academics and industrial engineers who are

interested in the theory and practice of methods and tools for the design and programming of trustworthy software systems. The common themes of the courses include the design and use of theories, techniques and tools for software specification and modeling, analysis and verification. The courses cover sequential programming, component and object software, hybrid systems and cyber physical systems with challenges of termination, security, safety, security fault tolerance and real time requirements. The techniques include model checking, correctness by construction through refinement and model transformations, synthesis and computer algebra.

Software Architectures Manfred Nagl, Bernhard Westfechtel, 2024-04-26. This textbook concentrates on processes, activities and results related to software architectures. It describes the separation of architecture artefacts corresponding to their nature, their logical or their modeling level on one hand and at the same time emphasizes their integration based on their mutual relations. Design or development processes demand for integration as different artifacts must be elaborated which are mutually dependent and need to be in a consistent form. The book is structured in four parts. The introductory Part I deals with the relevance of architectures, the central role of the design subprocess both in development or maintenance and the importance of the decisions and artefacts in the overall result. Another topic is the spectrum of views an architecture language has to offer and that there are different architectures to be regarded from abstract and static to detailed technical and specific. Part II then discusses important topics on the architecture level. It deals with adaptability, especially for embedded systems with integrating styles, pattern notations with different reuse forms and how to find them with the role of architectures for integrating different existing systems and with reverse and reengineering of legacy systems. Next Part III covers architecture modeling and its relation to surrounding activities as well as architectures to surrounding other results. The single chapters are on transformation between requirements and architectures, architectures and programming, architectures and project management and organization as well as architectures and their relations to quality assurance or documentation. Eventually Part IV summarizes the main messages and presents open problems both for every single chapter and across chapters. Every chapter focuses on a specific problem, it addresses a question, it answers the attention it demands, a message it conveys and further open questions it raises. The chapters are mostly independent which implies a certain redundancy yet it allows lecturers and their students to either use the book as the basis of teaching software architecture or design or to just pick those aspects that need special attention in a more advanced course.
