Chapter 8 Memory
Study Guide

8.1 How Memory Functions

Memory is much like a computer in that it is a system of information processing and works to encode, store, and retrieve information over different periods of time.

The process of information processing begins at **encoding**, which is the input of information into our memory. Once taken in, our brains code the information and process it automatically or effortfully.

- In **automatic processing**, processing is done without conscious awareness and regards time, space, or definition-based information.
- **Effortful processing**, however requires more work and attention.
- Once processed, information can be coded in three ways: semantic, visual, or acoustic.
- **Semantic encoding** involves words and meaning while **visual encoding** and **acoustic encoding** are for images and sounds respectively.
- Once information has been processed and encoded, we have means to retain it through **storage** or permanently recorded information.

For memory to enter storage, three phases are required. Researchers Richard Atkinson and Richard Shiffrin describe a structure to better illustrate the process known as the Atkinson-Shiffrin model.
