Worker-Job Recommendation for Mixed Crowdsourcing Systems Julian Jarrett, 2017 Crowdsourcing is used as model to distribute work over the Internet via an open call to anonymous human workers who opt to take up work offerings sometimes for some small compensation Increasingly crowdsourcing systems are integrated into workflows to provide human computation capabilities These workflows consist of machine based workers that work harmoniously on different phases of a task with their human counterparts This body of work addresses workflows where machines and human workers have the capacity to fulfill the requirements for same tasks To maximize performance through the delegation of work to the most competent worker this work outlines a collaborative filtering based approach with a bottom up evaluation based on workers performance history and their inferred skillsets Within the model there are several algorithms formulae and evaluative metrics The work also introduces the notion of an Open Push Pull model a paradigm that maximizes on the services and strengths of the open call model while seeking to address its weaknesses such as platform lock in that affects access to jobs and availability of the worker pool The work outlines the model in terms of a service oriented architecture SOA It provides a supporting conceptual model for the architecture and an operational model that facilitates both human and machine workers It also defines

evaluative metrics for understanding the true capabilities of the worker pool Techniques presented in this work can be used to expand the potential worker pool to compete for tasks through the incorporation of machine oriented workers via virtualization and other electronic services and human workers via existing crowds Results in this work articulate the flexibility of our approach to support both human and machine workers within a competitive model while supporting tasks spanning multiple domains and problem spaces It addresses the inefficiencies of current top down approaches in worker job recommendation through use of a bottom up approach which adapts to dynamic and rapidly changing data The work contrasts the shortcomings of top down approaches dependency on professed profiles which can be under represented over represented or falsified in other ways with evaluative metrics that can be used for the individual and collective assessment of workers within a labor pool
