

Photosynthesis - Review

1) Define light reaction.

The light-dependent reaction is the first stage of photosynthesis. It uses light energy and takes place in the thylakoid membranes of the organelles called chloroplasts.

2) What is dark reaction?

Light-independent reaction is the second stage of photosynthesis. It converts carbon dioxide and other compounds into glucose. It occurs in stroma.

3) Complete the following chart.

	Light Reactions	Dark Reactions
Location	Thylakoid	Stroma
Reactants	Sunlight + H_2O	ATP + NADPH + CO_2
Products	ATP + NADPH + O_2	Sugar

4) List any three differences between light and dark reactions.

Light Reactions	Dark Reactions
This is a light-dependent reaction.	This is a light-independent reaction.
Light is absorbed and O_2 is released.	CO_2 is absorbed and reduced.
ATP and NADPH are the end products.	Uses the end products of light reactions to produce glucose.

Stress Responses of Photosynthetic Organisms Kimiyuki Satoh, Norio Murata, 2012-12-02 Sixteen topics from the results of the research project Molecular Mechanisms for Responses of the Photosynthetic Apparatus to the Environment are documented in this excellent and timely work Photosynthesis research has a long history in Japan and many Japanese laboratories working in this field have been very active and productive Based on the foundation established by these laboratories the research reflected in this book focuses on elucidating the interactions between photosynthesis and the environment with special emphasis on the molecular aspects of these interactions The major purpose of the research was to identify specific genes required for a repair of the organisms from stress induced damage to the photosynthetic machinery and b acclimation of photosynthetic processes to specific changes in environmental conditions Once specific genes were identified the effects of expression and overexpression of these genes in transgenic plants on acclimation processes were analyzed Through the analysis of transgenic plants and cyanobacteria the volume clarifies a number of molecular mechanisms by which plants acclimate to environmental variations and the factors that govern recovery from stress induced damage especially with respect to the photosynthetic apparatus A treatise on stress physiology and photosynthesis the book also indicates the agricultural usefulness of transgenic plants and microalgae which are produced to study the molecular mechanisms of the tolerance of plants to changes in their environment

Physiological Responses of Plants to Attack Dale Walters, 2015-02-23 Despite the research effort put into controlling pathogens pests and parasitic plants crop losses are still a regular feature of agriculture worldwide This makes it important to manage the crop appropriately in order to maximise yield Understanding the relationship between the occurrence and severity of attack and the resulting yield loss is an important step towards improved crop protection Linked to this is the need to better understand the mechanisms responsible for reductions in growth and yield in affected crops Physiological Responses of Plants to Attack is unique because it deals with the effects of different attackers pathogens herbivores and parasitic plants on host processes involved in growth reproduction and yield Coverage includes effects on photosynthesis partitioning of carbohydrates water and nutrient relations and changes in plant growth hormones Far from being simply a consequence of attack the alterations in primary metabolism reflect a more dynamic and complex interaction between plant and attacker sometimes involving re programming of plant metabolism by the

Crop Responses and Adaptations to Temperature Stress Amarjit Basra, 2023-04-28 Examine the ways in which various plants respond when exposed to high and low temperatures The growing demand for food makes breeding for high yielding crops with built in resistance against environmental constraints one of the most important challenges for plant breeders today Crop Responses and Adaptations to Temperature Stress investigates the adaptive mechanisms plants have evolved in response to unfavorable temperature conditions It describes gene transfer technology and other tolerance improvement techniques that aid in developing stress tolerant plants Adverse environmental stress conditions such as extreme temperatures affect the productivity of important world food crops by inhibiting plant growth and development Crop Responses and Adaptations to Temperature Stress provides valuable information on the mechanisms of stress tolerance in plants that encourage growth and enhance yield performance Agriculture professionals researchers and plant breeders will

benefit from the ideas shared on such topics as mechanisms of chilling injury and tolerance injury and acclimation of root system functions during chilling temperatures mechanisms of cold acclimation signal transduction under low temperature stress mechanisms of thermotolerance in crops control of the heat shock response in crop plants the effects of heat stress on cereal yield and quality Crop Responses and Adaptations to Temperature Stress presents detailed discussions on the effects and outcomes of crop exposure to low and high temperatures The textual information is liberally supplemented with visual representations of field experiment data as well as comprehensive tables and schematic drawings In addition to a detailed review of current knowledge on the molecular biology of plant responses to temperature stress and an introduction to biotechnological advances in improving crop tolerance Crop Responses and Adaptations to Temperature Stress suggests avenues for further study and speculates on the implications of such work for the future of food production
