Non Euclidean Geometry:

Non-Euclidean Geometry Roberto Bonola, 2012-08-15 Examines various attempts to prove Euclid's parallel postulate by the Greeks Arabs and Renaissance mathematicians It considers forerunners and founders such as Saccheri Lambert Legendre W Bolyai Gauss others Includes 181 diagrams **Non-Euclidean Geometry: Sixth Edition** H. S. M. Coxeter, 1998-12-31 A reissue of Professor Coxeter's classic text on non euclidean geometry Introduction to Non-Euclidean Geometry Harold E. Wolfe, 2013-09-26 College level text for elementary courses covers the fifth postulate hyperbolic plane geometry and trigonometry and elliptic plane geometry and trigonometry Appendixes offer background on Euclidean geometry Numerous exercises 1945 edition **Euclidean and Non-Euclidean Geometries** Marvin J. Greenberg, 1993-07-15 This classic text provides overview of both classic and hyperbolic geometries placing the work of key mathematicians philosophers in historical context Coverage includes geometric transformations models of the hyperbolic planes and pseudospheres **Introduction to Non-Euclidean Geometry** EISENREICH, 2014-06-28 An Introduction to Non Euclidean Geometry covers some introductory topics related to non Euclidian geometry including hyperbolic and elliptic geometries This book is organized into three parts encompassing eight chapters The first part provides mathematical proofs of Euclid's fifth postulate concerning the extent of a straight line and the theory of parallels The second part describes some problems in hyperbolic geometry such as cases of parallels with and without a common perpendicular This part also deals with horocycles and triangle relations The third part examines single and double elliptic geometries This book will be of great value to mathematics liberal arts and philosophy major students **A Simple Non-Euclidean Geometry and Its Physical Basis** I.M. Yaglom, 2012-12-06 There are many technical and popular accounts both in Russian and in other languages of the non Euclidean geometry of Lobachevsky and Bolyai a few of which are listed in the Bibliography This geometry also called hyperbolic geometry is part of the required subject matter of many mathematics departments in universities and teachers colleges a reflection of the view that familiarity with the elements of hyperbolic geometry is a useful part of the background of future high school teachers Much attention is paid to hyperbolic geometry by school mathematics clubs Some mathematicians and educators concerned with reform of the high school curriculum believe that the required part of the curriculum should include elements of hyperbolic geometry and that the optional part of the curriculum should include a topic related to hyperbolic geometry I The broad interest in hyperbolic geometry is not surprising This interest has little to do with mathematical and scientific applications of hyperbolic geometry since the applications for instance in the theory of automorphic functions are rather specialized and are likely to be encountered by very few of the many students who conscientiously study and then present to examiners the definition of parallels in hyperbolic geometry and the special features of configurations of lines in the hyperbolic plane The principal reason for the interest in hyperbolic geometry is the important fact of non uniqueness of geometry of the existence of many geometric systems **The Elements of**

Non-Euclidean Geometry Julian Lowell Coolidge, PhD, 2020-06-04 In this book Dr Coolidge explains non Euclidean geometry which consists of two geometries based on axioms closely related to those specifying Euclidean geometry As Euclidean geometry lies at the intersection of metric geometry and affine geometry non Euclidean geometry arises when either the metric requirement is relaxed or the parallel postulate is replaced with an alternative one In the latter case one obtains hyperbolic geometry and elliptic geometry the traditional non Euclidean geometries When the metric requirement is relaxed then there are affine planes associated with the planar algebras which give rise to kinematic geometries that have also been called non Euclidean geometry The essential difference between the metric geometries is the nature of parallel lines Euclid's fifth postulate the parallel postulate is equivalent to Playfair's postulate which states that within a two dimensional plane for any given line l and a point A which is not on l there is exactly one line through A that does not intersect l In hyperbolic geometry by contrast there are infinitely many lines through A not intersecting l while in elliptic geometry any line through A intersects l Another way to describe the differences between these geometries is to consider two straight lines indefinitely extended in a two dimensional plane that are both perpendicular to a third line In Euclidean geometry the lines remain at a constant distance from each other meaning that a line drawn perpendicular to one line at any point will intersect the other line and the length of the line segment joining the points of intersection remains constant and are known as parallels In hyperbolic geometry they curve away from each other increasing in distance as one moves further from the points of intersection with the common perpendicular these lines are often called ultraparallels In elliptic geometry the lines curve toward each other and intersect

The Elements of Non-Euclidean Geometry D. M.Y. Sommerville, 2012-05-24 Renowned for its lucid yet meticulous exposition this classic allows students to follow the development of non Euclidean geometry from a fundamental analysis of the concept of parallelism to more advanced topics 1914 edition Includes 133 figures

A History of Non-Euclidean Geometry Boris A. Rosenfeld, 2012-09-08 The Russian edition of this book appeared in 1976 on the hundred and fiftieth anniversary of the historic day of February 23 1826 when Lobachevskii delivered his famous lecture on his discovery of non Euclidean geometry The importance of the discovery of non Euclidean geometry goes far beyond the limits of geometry itself It is safe to say that it was a turning point in the history of all mathematics The scientific revolution of the seventeenth century marked the transition from mathematics of constant magnitudes to mathematics of variable magnitudes During the seventies of the last century there occurred another scientific revolution By that time mathematicians had become familiar with the ideas of non Euclidean geometry and the algebraic ideas of group and field all of which appeared at about the same time and the later ideas of set theory This gave rise to many geometries in addition to the Euclidean geometry previously regarded as the only conceivable possibility to the arithmetics and algebras of many groups and fields in addition to the arithmetic and algebra of real and complex numbers and finally to new mathematical systems i.e. sets furnished with various structures having no classical analogues Thus in the 1870's there

began a new mathematical era usually called until the middle of the twentieth century the era of modern mathematics

The Foundations of Geometry and the Non-Euclidean Plane G.E. Martin, 1997-12-19 This book is a text for junior senior or first year graduate courses traditionally titled Foundations of Geometry and or Non Euclidean Geometry The first 29 chapters are for a semester or year course on the foundations of geometry The remaining chapters may then be used for either a regular course or independent study courses Another possibility which is also especially suited for in service teachers of high school geometry is to survey the fundamentals of absolute geometry Chapters 1-20 very quickly and begin earnest study with the theory of parallels and isometries Chapters 21-30 The text is self contained except that the elementary calculus is assumed for some parts of the material on advanced hyperbolic geometry Chapters 31-34 There are over 650 exercises 30 of which are 10 part true or false questions A rigorous ruler and protractor axiomatic development of the Euclidean and hyperbolic planes including the classification of the isometries of these planes is balanced by the discussion about this development Models such as Taxicab Geometry are used extensively to illustrate theory Historical aspects and alternatives to the selected axioms are prominent The classical axiom systems of Euclid and Hilbert are discussed as are axiom systems for three and four dimensional absolute geometry and Pieri's system based on rigid motions The text is divided into three parts The Introduction Chapters 1-4 is to be read as quickly as possible and then used for reference if necessary
