Cheng, 2010-01-18 In many parts of the world groundwater resources are under increasing threat from growing demands wasteful use and contamination To face the challenge good planning and management practices are needed A key to the management of groundwater is the ability to model the movement of fluids and contaminants in the subsurface The purpose of this book is to construct conceptual and mathematical models that can provide the information required for making decisions associated with the management of groundwater resources and the remediation of contaminated aquifers The basic approach of this book is to accurately describe the underlying physics of groundwater flow and solute transport in heterogeneous porous media starting at the microscopic level and to rigorously derive their mathematical representation at the macroscopic levels The well posed macroscopic mathematical models are formulated for saturated single phase flow as well as for unsaturated and multiphase flow and for the transport of single and multiple chemical species Numerical models are presented and computer codes are reviewed as tools for solving the models The problem of seawater intrusion into coastal aquifers is examined and modeled The issues of uncertainty in model input data and output are addressed The book concludes with a chapter on the management of groundwater resources Although one of the main objectives of this book is to construct mathematical models the amount of mathematics required is kept minimal Conductive Polymers Ze Zhang, Mahmoud Rouabhia, Simon E. Moulton, 2018-09-03 This book is dedicated to the field of conductive polymers focusing on electrical interactions with biological systems It addresses the use of conductive polymers as the conducting interface for electrical communications with the biological system both in vitro and in vivo It provides an overview on the chemistry and physics of conductive polymers their useful characteristics as well as limitations and technologies that apply conductive polymers for medical purposes This groundbreaking resource addresses cytotoxicity and tissue compatibility of conductive polymers the basics on electromagnetic fields and commonly used experimental methods Readers will also learn how cells are cultured in vitro with conductive polymers and how conductive polymers and living tissues interact electrically Throughout the contents chapter

authors emphasize the importance of conductive polymers in biomedical engineering and their potential applications in medicine A Manual on the Theory and Measurement of Plant-soil Water Relations R. E. Munns,1980 Fundamentals of Modeling and Analyzing Engineering Systems Philip D. Cha,James J. Rosenberg,Clive L. Dym,2000-04-13 System modeling and analysis is a standard activity in every engineering discipline This text offers a broad based introduction to engineering systems incorporating material from mechanical electrical aerospace and chemical engineering The overall theme that distinguishes the text from others is its unified treatment of disparate physical systems emphasizing similarities in both the modeling and behaviour of lumped element systems Linear graph theory provides the framework for modeling engineering systems as lumped elements The analysis of system dynamics that follows is organized by behavioral characteristics rather than by engineering subdisciplines Next the Laplace transform is introduced as a tool for understanding frequency response The final chapter covers feedback systems Every chapter includes a wide variety of examples as well as exercise problems drawn from real world mechanical electrical hydraulic chemical and thermal systems Aimed at second and third year undergraduates this introductory text offers a unified entry to the multidisciplinary world of engineering *CIM Bulletin* Canadian Institute of Mining and Metallurgy,1998 Cumulated Index Medicus ,1980
