Application In The Treatment Of Periodontal Disease Dr. Kunal Keshaw, 2023-03-25 Periodontitis is an inflammatory disease of the periodontium which is initiated and propagated by bacteria The main goal of nonsurgical periodontal therapy is to reduce pathogenic bacteria by scaling and root planing SRP However there are some limitations to closed mechanical debridement such as presence of root curvatures furcation involvement and deep pocket Also patients having risks of systemic disease hereditary factors and smoking which are accompanied by persistent infection with particular periodontal pathogenic bacteria recolonization of the periodontal tissues by pathogens is common after treatment These problems necessitate other protocols with the aim of potentiating the effects of mechanical therapy Among these protocols Photodynamic therapy PDT acts as an adjunctive approach to nonsurgical periodontal treatment in patients with periodontitis PDT was first used in the treatment of neoplasms It requires the use of a photosensitizing agent which is activated by light to destroy bacteria and their by products Moreover the PDT is also associated with risks and side effects related to light energy
