Nonnegative And Compartmental Dynamical Systems:

Nonnegative and Compartmental Dynamical Systems Wassim M. Haddad, VijaySekhar Chellaboina, Qing Hui, 2010-01-04
This comprehensive book provides the first unified framework for stability and dissipativity analysis and control design for nonnegative and compartmental dynamical systems which play a key role in a wide range of fields including engineering thermal sciences biology ecology economics genetics chemistry medicine and sociology Using the highest standards of exposition and rigor the authors explain these systems and advance the state of the art in their analysis and active control design Nonnegative and Compartmental Dynamical Systems presents the most complete treatment available of system solution properties Lyapunov stability analysis dissipativity theory and optimal and adaptive control for these systems addressing continuous time discrete time and hybrid nonnegative system theory This book is an indispensable resource for applied mathematicians dynamical systems theorists control theorists and engineers as well as for researchers and graduate students who want to understand the behavior of nonnegative and compartmental dynamical systems that arise in areas such as biomedicine demographics epidemiology pharmacology telecommunications transportation thermodynamics networks heat transfer and power systems *Biology and Control Theory: Current Challenges* Isabelle Queinnec, Sophie Tarbouriech, Germain Garcia, Silviu-Iulian Niculescu, 2007-08-07 Creating some links between control feedback and biology modeling communities based on similarities in modeling observing and perceiving alive structures and analyzing interconnections between biological structures and subsystems was the main objective of this volume In this context biology systems need appropriate analysis tools due to their structure and hierarchy complexity and environment interference and we believe that these aspects may generate interesting research topics in control area Indeed several works raising the potential impact of control developments to bring some beginning of answers in the context of biological systems have been published in the recent years The idea of this book was conceived in the context mentioned above with the objective to help in claiming many of the problems for control researchers starting discussions and opening interactive debates between the control and biology communities and finally to alert graduate students to the many interesting ideas at the frontier between control feedback theory and biology Impulsive and Hybrid Dynamical Systems Wassim M. Haddad, VijaySekhar Chellaboina, Sergey G. Nersisov, 2014-09-08 This book develops a general analysis and synthesis framework for impulsive and hybrid dynamical systems Such a framework is imperative for modern complex engineering systems that involve interacting continuous time and discrete time dynamics with multiple modes of operation that place stringent demands on controller design and require implementation of increasing complexity whether advanced high performance tactical fighter aircraft and space vehicles variable cycle gas turbine engines or air and ground transportation systems Impulsive and Hybrid Dynamical Systems goes beyond similar treatments by developing invariant set stability theorems partial stability Lagrange stability boundedness ultimate boundedness dissipativity theory vector dissipativity theory energy based hybrid control

optimal control disturbance rejection control and robust control for nonlinear impulsive and hybrid dynamical systems A major contribution to mathematical system theory and control system theory this book is written from a system theoretic point of view with the highest standards of exposition and rigor It is intended for graduate students researchers and practitioners of engineering and applied mathematics as well as computer scientists physicists and other scientists who seek a fundamental understanding of the rich dynamical behavior of impulsive and hybrid dynamical systems

Advances in Time-Delay Systems Silviu-Iulian Niculescu, Kebin Gu, 2012-12-06 In the mathematical description of a physical or biological process it is a common practice to assume that the future behavior of the process considered depends only on the present state and therefore can be described by a finite set of ordinary differential equations This is satisfactory for a large class of practical systems However the existence of time delay elements such as material or information transport of the system renders such description unsatisfactory in accounting for important behaviors of many practical systems Indeed due largely to the current lack of effective methodology for analysis and control design for such systems the time delay elements are often either neglected or poorly approximated which frequently results in analysis and simulation of insufficient accuracy which in turn leads to poor performance of the systems designed Indeed it has been demonstrated in the area of automatic control that a relatively small delay may lead to instability or significantly deteriorated performances for the corresponding closed loop systems

A Dynamical Systems Theory of Thermodynamics Wassim M. Haddad, 2019-06-04 A brand new conceptual look at dynamical thermodynamics This book merges the two universalisms of thermodynamics and dynamical systems theory in a single compendium with the latter providing an ideal language for the former to develop a new and unique framework for dynamical thermodynamics In particular the book uses system theoretic ideas to bring coherence clarity and precision to an important and poorly understood classical area of science The dynamical systems formalism captures all of the key aspects of thermodynamics including its fundamental laws while providing a mathematically rigorous formulation for thermodynamical systems out of equilibrium by unifying the theory of mechanics with that of classical thermodynamics This book includes topics on nonequilibrium irreversible thermodynamics Boltzmann thermodynamics mass action kinetics and chemical reactions finite time thermodynamics thermodynamic critical phenomena with continuous and discontinuous phase transitions information theory continuum and stochastic thermodynamics and relativistic thermodynamics A Dynamical Systems Theory of Thermodynamics develops a postmodern theory of thermodynamics as part of mathematical dynamical systems theory The book establishes a clear nexus between thermodynamic irreversibility the second law of thermodynamics and the arrow of time to further unify discreteness and continuity indeterminism and determinism and quantum mechanics and general relativity in the pursuit of understanding the most fundamental property of the universe the entropic arrow of time

Analysis and Synthesis of Dynamic Systems with Positive Characteristics Jun Shen, 2017-03-27 This thesis develops several systematic and unified approaches for analyzing dynamic systems with positive characteristics or a more

general cone invariance property Based on these analysis results it uses linear programming tools to address static output feedback synthesis problems with a focus on optimal gain performances Owing to their low computational complexity the established controller design algorithms are applicable for large scale systems The theory and control strategies developed will not only be useful in handling large scale positive delay systems with improved solvability and at lower cost but also further our understanding of the system characteristics in other related areas such as distributed coordination of networked multi agent systems formation control of multiple robots

Stability and Dissipativity Theory for Nonnegative and Compartmental Dynamical Systems Elias August, 2001 *Control of Uncertain Dynamic Systems* Shankar P.

Bhattacharyya, Lee H. Keel, 2020-09-23 This book is a collection of 34 papers presented by leading researchers at the International Workshop on Robust Control held in San Antonio Texas in March 1991 The common theme tying these papers together is the analysis synthesis and design of control systems subject to various uncertainties The papers describe the latest results in parametric understanding H₈ uncertainty l₁ optical control and Quantitative Feedback Theory QFT The book is the first to bring together all the diverse points of view addressing the robust control problem and should strongly influence development in the robust control field for years to come For this reason control theorists engineers and applied mathematicians should consider it a crucial acquisition for their libraries

Dynamical Systems José A. Tenreiro Machado, 2018-10-09 Printed Edition of the Special Issue Published in Entropy **Network Information Systems** Wassim M. Haddad, Qing Hui, Junsoo Lee, 2023-06-06 This text presents a unique treatment of network control systems Drawing from fundamental principles of dynamical systems theory and dynamical thermodynamics the authors develop a continuous time discrete time and hybrid dynamical system and control framework for linear and nonlinear large scale network systems The proposed framework extends the concepts of energy entropy and temperature to undirected and directed information networks Continuous time discrete time and hybrid thermodynamic principles are used to design distributed control protocol algorithms for static and dynamic networked systems in the face of system uncertainty exogenous disturbances imperfect system network communication and time delays Network Information Systems A Dynamical Systems Approach is written for applied mathematicians dynamical systems theorists control theorists and engineers Researchers and graduate students in a variety of fields who seek a fundamental understanding of the rich behavior of controlled large scale network systems will also find this book useful This book can be used for a first course on control design of large scale network systems such as control protocols for network systems network information systems a dynamical systems approach to network systems and network thermodynamic systems The prerequisites are a first course in nonlinear systems theory and a first course in advanced multivariable calculus
