Software testing is becoming increasingly important because more and more products are software intensive Cars for example contain more and more control software ECUs that are networked with each other With new rail vehicles software problems delay commissioning by months even years because the different components are not coordinated with each other A timely system test would help but there is a lack of time and resources The functionality of the software is simply too great So you must automate Automation is not only necessary for the execution of tests but above all for the generation of suitable test cases This is possible with Combinatory Logic the Analytic Hierarchy Process AHP and Quality Function Deployment QFD When today s cars use map services from the cloud or their own sensors for an Advanced Driving Assistance System ADAS to perform driving decisions or when in the future an autonomous car meets another or with truck platooning or when adding a new previously unknown device to an IoT orchestra the original base system expands its functionality Therefore such an expanding system needs being retested before it can do decisions with the potential of affecting harm to humans or things after each update after each learning This is Continuous Testing during operation it supplements Continuous Delivery and Continuous Integration Disruptive innovations in automotive require an equally disruptive new approach to testing of software intense systems This requires moving from once upon a time testing before release to autonomous real time software systems testing during operations with indications to users and suppliers about the actual state and testing results This book explains the theory and the implementation approach for a framework for Autonomous Real time Testing ART of a software intense system while in operation
