Tominaga, E. Tachikawa, 2012-12-06 Hot atom chemistry is a unique field of chemistry dealing with highly excited chemical species resulting from nuclear reactions or radioactive decay processes Modern hot atom chemistry includes a broad range of disciplines such as fundamental studies from physical chemistry of gas phase energetic reactions to inorganic solid state chemistry as well as recent practical applications in life sciences and energy related research In spite of the importance of hot atom chemistry and its appli cations its relevance to the other fields of chemistry and related disciplines has attracted little attention and only books and review articles for dedicated hot atom

chemists have been published to date In this volume we illustrate the essential aspects of modern hot atom chemistry for non specialists with considerable emphasis on its applications in the related fields We sincerely hope that this volume can promote mutual understanding and collaboration between hot atom chemists and researchers in other disciplines After a brief introduction Chap 1 the 2nd chapter gives the non specialist an idea of experimental techniques commonly used for the production and analysis of hot chemical species In Chap 3 we have explained the concepts of hot atom reactions in gas liquid and solid phases with typical examples rather than a comprehensive review of the literature In view of the current state of accomplishment the greater part of this chapter is concerned with gas phase studies Regarding the solid phase hot atom chemistry we have confined ourselves only to introducing new concepts and discussing modern aspects
