Computational Reconstruction of Missing Data in Biological Research Feng Bao, 2021-08-06 The emerging biotechnologies have significantly advanced the study of biological mechanisms However biological data usually contain a great amount of missing information e g missing features missing labels or missing samples which greatly limits the extensive usage of the data In this book we introduce different types of biological data missing scenarios and propose machine learning models to improve the data analysis including deep recurrent neural network recovery for feature missings robust information theoretic learning for label missings and structure aware rebalancing for minor sample missings Models in the book cover the fields of imbalance learning deep learning recurrent neural network and statistical inference providing a wide range of references of the integration between artificial intelligence and biology With simulated and biological datasets we apply approaches to a variety of biological tasks including single cell characterization genome wide association studies medical image segmentations and quantify the performances in a number of successful metrics The outline of this book is as follows In Chapter 2 we introduce the statistical recovery of missing data features in Chapter 3 we introduce the statistical recovery of missing labels in Chapter 4 we introduce the statistical recovery of missing data sample information finally in Chapter 5 we summarize the full text and outlook future directions This book can be used as references for researchers in computational biology bioinformatics and biostatistics Readers are expected to have basic knowledge of statistics and machine learning

Research at the Intersection of the Physical and Life Sciences National Research Council, Division on Earth and Life Studies, Division on Engineering and Physical Sciences, Board on Chemical Sciences and Technology, Board on Life Sciences, Board on Physics and Astronomy, Committee on Research at the Intersection of the Physical and Life Sciences, 2010-03-25 Traditionally the natural sciences have been divided into two branches the biological sciences and the physical sciences Today an increasing number of scientists are addressing problems lying at the intersection of the two These problems are most often biological in nature but examining them through the lens of the physical sciences can yield exciting

results and opportunities For example one area producing effective cross discipline research opportunities centers on the dynamics of systems Equilibrium multistability and stochastic behavior concepts familiar to physicists and chemists are now being used to tackle issues associated with living systems such as adaptation feedback and emergent behavior Research at the Intersection of the Physical and Life Sciences discusses how some of the most important scientific and societal challenges can be addressed at least in part by collaborative research that lies at the intersection of traditional disciplines including biology chemistry and physics This book describes how some of the mysteries of the biological world are being addressed using tools and techniques developed in the physical sciences and identifies five areas of potentially transformative research Work in these areas would have significant impact in both research and society at large by expanding our understanding of the physical world and by revealing new opportunities for advancing public health technology and stewardship of the environment This book recommends several ways to accelerate such cross discipline research Many of these recommendations are directed toward those administering the faculties and resources of our great research institutions and the stewards of our research funders making this book an excellent resource for academic and research institutions scientists universities and federal and private funding agencies
