Title: Plot the characteristic curves of RTD and Thermocouple

Objectives:

- Explore the working principle of RTD and Thermocouple
- Study signal conditioning circuits of RTD and Thermocouple
- Plot and investigate the characteristic curves of RTD and Thermocouple

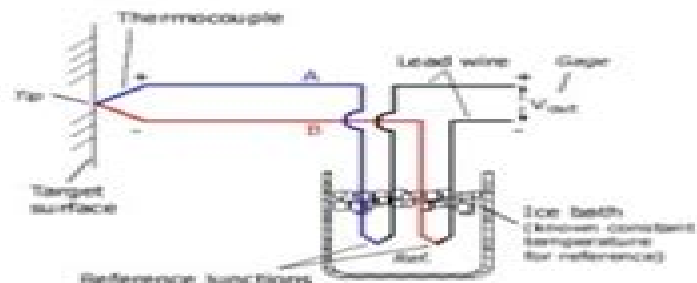

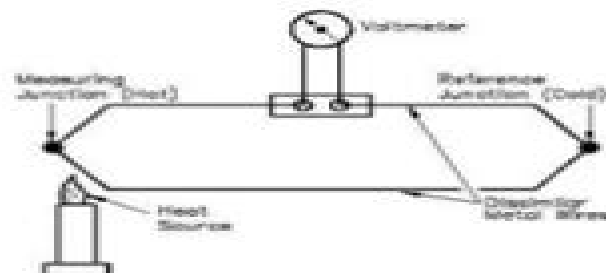

Theory:

Resistive Temperature Detectors (RTDs):

RTDs are made up of metal wire or fiber material that responds to temperature change by changing resistance. Platinum, nickel, and tungsten are mostly used that have high resistivity, good temperature coefficient of resistance, good tensile strength and chemical inertness with packaging and insulation materials. The change in resistance can be determined using a bridge circuit. RTDs are generally more accurate than thermocouples, but are less rugged and cannot be used at high temperatures.

Thermocouples:

Thermocouple is the most popular type of sensor. It is based on the principle that two wires made of dissimilar materials connected at either end will generate a potential between the two ends that is the function of materials and temperature difference between two ends. Base metal thermocouples are useful for measurement of temperatures under 1000 degree Celsius. This class includes iron/constantan (Type J), Chromel/Alumel (Type K) and number of others. Nobel metal thermocouples are useful to about 2000 degree Celsius. This class includes tungsten-rhenium alloy thermocouples and others. The potential generated is in millivolts and is a nonlinear function of temperature. In practice, one end is placed near the material to be measured (measuring junction) and the other end is connected to the instrument. Inside instrument is a reference junction whose temperature is maintained using appropriate heat insulation.
