Offering practical advice on a range of wavelengths this highly accessible and self contained book presents a broad overview of astronomical instrumentation techniques and tools Drawing on the notes and lessons of the authors established graduate course the text reviews basic concepts in astrophysics spectroscopy and signal analysis It includes illustrative problems and case studies and aims to provide readers with a toolbox for observational capabilities across the electromagnetic spectrum and the knowledge to understand which tools are best suited to different observations It is an ideal guide for undergraduates and graduates studying astronomy Features Presents a self contained account of a highly complex subject Offers practical advice and instruction on a wide range of wavelengths and tools Includes case studies and problems for further learning opportunities Solutions Manual available upon qualifying course adoption *Applications of Big Data and Machine Learning*

in Galaxy Formation and Evolution Tsutomu T. Takeuchi, 2025-04-29 As investigations into our Universe become more complex in depth and widespread galaxy surveys are requiring state of the art data scientific methods to analyze them This book provides a practical introduction to big data in galaxy formation and evolution introducing the astrophysical basics before delving into the latest techniques being introduced to astronomy and astrophysics from data science This book helps translate the cutting edge methods into accessible guidance for those without a formal background in computer science It is an ideal manual for astronomers and astrophysicists in addition to graduate students and postgraduate students in science and engineering looking to learn how to apply data science to their research Key Features Introduces applications of data science methods to the exciting subject of galaxy formation and evolution Provides a practical guide to understanding cutting edge data scientific methods as well as classical astrostatistical methods Summarises a vast range of statistical and informatics methods in one volume with concrete applications to astrophysics An Overview of General Relativity and

Space-Time Nicola Vittorio, 2022-12-29 This textbook equips Masters students studying Physics and Astronomy with the necessary mathematical tools to understand the basics of General Relativity and its applications It begins by reviewing classical mechanics with a more geometrically oriented language continues with Special Relativity and then onto a discussion on the pseudo Riemannian space times Applications span from the inner and outer Schwarzschild solutions to gravitational wave black holes spherical relativistic hydrodynamics and Cosmology The goal is to limit the abstract formalization of the problems to favor a hands on approach with a number of exercises without renouncing to a pedagogical derivation of the main mathematical tools and findings Features Provides a self contained introduction to General Relativity and to its standar applications Presents readers with all the tools necessary for further learning and research in the field Accessible to readers with just foundational knowledge of linear algebra and Lagrangian mechanics **A Guide to Close Binary Systems** Edwin

Budding, Osman Demircan, 2022-05-12 Introduction to Close Binary Systems provides a comprehensive survey and guide to

the fast moving field of multiple specifically binary stars with an up to date account of research around close i e interacting pairs Such interactions allow direct quantification of stellar properties opening up factual insights into basic building blocks of the Universe The book provides a much needed update for the seminal Close Binary Systems of Zden k Kopal Following a comparable plan it presents relevant subject matter with an emphasis on building a framework of understanding to serve as a supporting resource for students and researchers The text starts from a general historical background and progresses into the main theoretical ideas supporting our prima facie interpretation of observations The central chapters explore further into these observational methods arranged according to the classic subdivisions of astrometry spectroscopy and photometry Optimal inversion of observational data into model parametrization is a theme through these chapters Significant here is the problem of how non uniqueness in modelling affects interpretation The underlying issues of stellar evolution bearing on observational evidence become paramount in the last four chapters The book proceeds step by step from directly understandable examples of unevolved pairs to the challenging cases where stars are found in more and more extreme conditions leading up to the mergers of massive black hole pairs seen in the new field of gravitational wave astronomy This is a valuable reference for postgraduate and advanced undergraduate students working in mainstream areas of stellar astrophysics with applications also to exoplanet research which shares some methodological features Course designers for stellar astrophysics will find a useful selection of topics within this book Key features Provides a well explained and backgrounded up to date account of close binary systems in a fast moving field of research that is growing in scientific importance Surveys a wide range of case studies within the context of binary and multiple star systems Fills an acknowledged gap in current literature
