

Some 145 participants completed the questionnaire during the scent phase of the experiment. The experimenters had collected the same data from 447 people during the control week and explained that this larger number was to ensure that they had data for other experiments.

Questionnaires asked about perceptions of product quality, and about their perceptions of the shopping mall in general. Participants were also asked how much they had spent, excluding groceries, in this visit to the mall.

Findings

The researchers concluded that scent contributes to a favourable perception of a shopping environment and indirectly to an increased perception of product quality (thus supporting the cognition–emotion model discussed earlier). The use of an ambient scent is a relatively inexpensive technique for a retailer to consider. Although a product-related scent may be effective in increasing the sales of a particular product it may also reduce the sales of other products. The ambient scent needs to support all products in the store.

Reflections: Suggest appropriate scents for a furniture store, grocery store and a high-end fashion store.

Evaluation

The studies conducted by Kutlu et al. and by Chebat and Michon were conducted in *real retail environments*; Kutlu et al. in Istanbul and Chebat and Michon in Canada. Kutlu et al. *did not manipulate any variables* but simply measured the lighting levels in the store and measured customers' perception of this. In contrast, Chebat and Michon manipulated the presence of a pleasing citrus odour and

compared both *customer perceptions* and *spending* with a 'no odour' condition. Despite the differences in method, there are similar strengths and weaknesses here. Both studies would have struggled to control other variables that may be influencing consumers, although it is possible to generalise the findings from both studies to other environments and these studies have *clear applications to everyday life*. Both clearly showed the *impact that environmental cues such as colour, light and scent (situation)* may have on the individual and their cognitions and behaviours. This supports the importance of situational rather than individual factors in determining behaviour although we should always be aware that individual characteristics are going to be important as well. As with other topics in this section, the *exact effects* of factors such as light, colour and scent are likely to vary significantly from one culture to another.

There are *few ethical issues* to consider here as neither study could be considered to cause any type of *psychological distress to the participants* who would have consented to being questioned. Although it could be argued that Chebat and Michon's participants *were not aware* that they were taking part in an experiment, we are subject to this kind of experimenter manipulation every time we walk into a store.

7.2 The psychological environment

Environmental influences on consumers

Cognitive maps of retail locations

The *aim* of the study by Mackay and Olshavsky (1975) was to *explore the use of cognitive maps* (Figure 7.5) in understanding consumer behaviour.

DEFINITION

cognitive map: an internal representation of an external geographical reality sometimes described as a mental map of one's physical environment. Asking someone to draw a map of their environment is one way of exploring what the important features of the environment are for them.

The researchers recruited *78 supermarket shoppers* from *eight busy supermarkets* in Bloomington, Indiana, USA, during both day and evening. They made sure that the *subject* was the *principal grocery shopper* for his or her household, that the store was their *main store for grocery shopping*, that they had *access to a car for grocery shopping* and that they were *familiar with* (had heard of) the other *seven grocery stores*.

If they *met all four of these criteria* they were invited to participate in a *laboratory study* for which they
