Nonautonomous Linear Hamiltonian Systems Oscillation Spectral Theory And Control Developments In Mathematics:

Nonautonomous Linear Hamiltonian Systems: Oscillation, Spectral Theory and Control Russell Johnson, Rafael Obaya, Sylvia Novo, Carmen Núñez, Roberta Fabbri, 2016-03-25 This monograph contains an in depth analysis of the dynamics given by a linear Hamiltonian system of general dimension with nonautonomous bounded and uniformly continuous coefficients without other initial assumptions on time recurrence Particular attention is given to the oscillation properties of the solutions as well as to a spectral theory appropriate for such systems The book contains extensions of results which are well known when the coefficients are autonomous or periodic as well as in the nonautonomous two dimensional case However a substantial part of the theory presented here is new even in those much simpler situations The authors make systematic use of basic facts concerning Lagrange planes and symplectic matrices and apply some fundamental methods of topological dynamics and ergodic theory Among the tools used in the analysis which include Lyapunov exponents Weyl matrices exponential dichotomy and weak disconjugacy a fundamental role is played by the rotation number for linear Hamiltonian systems of general dimension The properties of all these objects form the basis for the study of several themes concerning linear quadratic control problems including the linear regulator property the Kalman Bucy filter the infinite horizon optimization problem the nonautonomous version of the Yakubovich Frequency Theorem and dissipativity in the Willems sense The book will be useful for graduate students and researchers interested in nonautonomous differential equations dynamical systems and ergodic theory spectral theory of differential operators and control theory Symplectic Difference Systems: Oscillation and Spectral Theory Ondřej Došlý, Julia Elyseeva, Roman Šimon Hilscher, 2019-09-06 This monograph is devoted to covering the main results in the qualitative theory of symplectic difference systems including linear Hamiltonian difference systems and Sturm Liouville difference equations with the emphasis on the oscillation and spectral theory As a pioneer monograph in this field it contains nowadays standard theory of symplectic systems as well as the most current results in this field which are based on the recently developed central object the comparative index The book contains numerous results and citations which were till now scattered only in journal papers The book also provides new applications of the theory of matrices in this field in particular of the Moore Penrose pseudoinverse matrices orthogonal projectors and symplectic matrix factorizations Thus it brings this topic to the attention of researchers and students in pure as well as applied mathematics **Physics Briefs** ,1993 *Mathematical Reviews* ,2004 *Index of Mathematical Papers* ,1985 **International Aerospace Abstracts** ,1997 **Spectral Theory of Nonautonomous Dynamical Systems and Applications** Thai Son Doan, 2024-12-27 The main challenge in the study of nonautonomous phenomena is to understand the very complicated dynamical behaviour both as a scientific and mathematical problem The theory of nonautonomous dynamical systems has experienced a renewed and steadily growing interest in the last twenty years stimulated also by

synergetic effects of disciplines which have developed relatively independent for some time such as topological skew product random dynamical systems finite time dynamics and control systems The book provides new insights in many aspects of the qualitative theory of nonautonomous dynamical systems including the spectral theory the linearization theory the bifurcation theory The book first introduces several important spectral theorem for nonautonomous differential equations including the Lyapunov spectrum Sacker Sell spectrum and finite time spectrum The author also establishes the smooth linearization and partial linearization for nonautonomous differential equations in application part Then the second part recalls the multiplicative ergodic theorem for random dynamical systems and discusses several explicit formulas in computing the Lyapunov spectrum for random dynamical systems generated by linear stochastic differential equations and random difference equations with random delay In the end the Pitchfork bifurcation and Hopf bifurcation with additive noise are investigated in terms of change of the sign of Lyapunov exponents and loss of topological equivalence This book might be appealing to researchers and graduate students in the field of dynamical systems stochastic differential equations ergodic theory

Integrable Hamiltonian systems and spectral theory Jürgen Moser, 1983-10-01 These notes are based on six Fermi Lectures held at the Scuola Normale Superiore in Pisa in March and April 1981 The topics treated depend on basic concepts of classical mechanics elementary geometry complex analysis as well as spectral theory and are meant for mathematicians and theoretical physicists alike These lectures weave together a number of threads from various fields of mathematics impinging on the subject of inverse spectral theory I did not try to give an overview over this fast moving subject but rather tie various aspects together by one guiding theme the construction of all potentials for the one dimensional Schrödinger equation which gives rise to finite band potentials which is done by reducing it to solving a system of differential equations In fact we will see that the problem of finding all almost periodic potentials having finitely many intervals as its spectrum is equivalent to the study of the geodesics on an ellipsoid To make this connection clear we have carried together several facts from classical mechanics and from spectral theory and we give a self contained exposition of the construction of these finite band potentials

Dynamical Systems Of Mathematical Physics: Spectral And Symplectic Integrability Analysis Denis

Blackmore, Anatoliy Karl Prykarpatsky, Valeriy Hr Samoylenko, 2011-03-04 This distinctive volume presents a clear rigorous grounding in modern nonlinear integrable dynamics theory and applications in mathematical physics and an introduction to timely leading edge developments in the field including some innovations by the authors themselves that have not appeared in any other book The exposition begins with an introduction to modern integrable dynamical systems theory treating such topics as Liouville Arnold and Mischenko Fomenko integrability This sets the stage for such topics as new formulations of the gradient holonomic algorithm for Lax integrability novel treatments of classical integration by quadratures Lie algebraic characterizations of integrability and recent results on tensor Poisson structures Of particular note is the development via

spectral reduction of a generalized de Rham Hodge theory related to Delsarte Lions operators leading to new Chern type classes useful for integrability analysis Also included are elements of quantum mathematics along with applications to Whitham systems gauge theories hadronic string models and a supplement on fundamental differential geometric concepts making this volume essentially self contained This book is ideal as a reference and guide to new directions in research for advanced students and researchers interested in the modern theory and applications of integrable especially infinite dimensional dynamical systems
