Geared toward a wide audience it may be used for upper level undergraduate or first year graduate courses and as a handy reference for professionals. The text covers all the basic unit processes used to fabricate integrated circuits including photolithography, plasma and reactive ion etching, ion implantation, diffusion, oxidation, evaporation, vapor phase epitaxial growth, sputtering, and chemical vapor deposition. Advanced processing topics such as rapid thermal processing, non-optical lithography, molecular beam epitaxy, and metal organic chemical vapor deposition are also presented. The physics and chemistry of each process is introduced along with descriptions of the equipment used for the manufacturing of integrated circuits. The text also discusses the integration of these processes into common technologies such as CMOS, double poly, bipolar, and GaAs MESFETs. Complexity, performance tradeoffs are evaluated along with a description of the current state of the art devices. Each chapter includes sample problems with solutions. The text makes use of the process simulation package SUPREM to demonstrate impurity profiles of practical interest.
