Copyright Office, 1975 [Logic Synthesis for Compositional Microprogram Control Units](#) Alexander Barkalov, Larysa Titarenko, 2008-07-17 One of the very important parts of any digital system is the control unit coordin ing interplay of other system blocks As a rule control units have irregular str ture which makes process of their logic circuits design very sophisticated In case of complex logic controllers the problem of system design is reduced practically to the design of control units Actually we observe a real technical boom connected with achievements in semiconductor technology One of these is the development of integrated circuit known as the systems on a programmable chip SoPC where the number of elements approaches one billion Because of the extreme complexity of microchips it is very important to develop effective design methods oriented on particular properties of logical elements Solution of this problem permits impr ing functional capabilities of the target digital system inside single SoPC chip As majority of researches point out design methods used in

case of industrial packages are in case of complex digital system design far from optimal. Similar problems concern the design of control units with standard old programmable logic devices FPLD such as PLA, PAL, GAL, CPLD and FPGA. Let us point out that modern SoPC are based on CPLD or FPGA technology. Thus the development of effective design methods oriented on FPLD implementation of logic circuits used in the control units still remains the problem of great importance.
