Heather Eicher-Miller,Marie Kainoa Fialkowski Revilla,2020-11-27 Food insecurity and low resources continue to be a burden influencing the health well being growth and development of millions of U S children and adults Groups and individuals experiencing restrained access to food are our neighbors individuals we may see each day and individuals who we may not interact with or see because of their isolated situations They include the elderly those experiencing mental illness veterans certain race ethnic groups adolescents young women with children those living in rural areas and those using food pantries among others Many of these groups both hidden and visible have rates of food insecurity above the national average that are resistant to national improvements in food security Yet attention to these subsets of the population is imperative to improve U S health and nutrition and to reduce rates of chronic disease Many groups face specific barriers to maintaining sufficient food for example rural populations may find it difficult to access federal food assistance or other resources such as food pantries and nutrition education because of distance or lack of consistent internet access separating them from these resources Further their remote locations may make it difficult to obtain the types of foods that they prefer Other specific

barriers may include limited facilities and equipment for food preparation access to culturally appropriate foods and preparation supplies and foods that complement the foods that they already have Tailored approaches to quantify access to food the nutrition environment dietary intake and other barriers are necessary to build successful interventions and to quantify the needs of these populations

Nutritional influences on human neurocognitive functioning Michael Smith, Andrew Scholey, 2014-11-04 You are what you eat It s a saying that we ve all heard time and time again The notion that good nutrition is essential for adequate growth and sound physical wellbeing is very well established Further in recent years there has been an overwhelming increase in research dedicated to better understanding how nutritional factors influence cognition and behaviour For example several studies have suggested that higher foetal exposure to omega 3 fatty acids and B vitamins such as folate promotes neurodevelopment B vitamins may also play a role in neurocognitive functioning in later life with some suggestion that lower vitamin B levels are associated with increased risk of dementia although randomised controlled trials investigating B vitamin supplementation as a cognitive enhancer in the elderly have provided inconclusive evidence as to the benefits of such therapy for dementia In fact the nutritional underpinnings of Alzheimer s disease and other disorders of cognitive ageing is becoming a much researched topic In addition consumption of several other foods has been found to convey more acute cognitively enhancing effects For example ingestion of carbohydrates e g glucose caffeine resveratrol and several nutraceutical herbal extracts has been associated with short term improvements in cognitive performance Beyond specific micronutrients and macronutrients the current literature seems to support anecdotal evidence that consumption of a balanced breakfast is crucial to various measures of school performance including attention in the classroom What is clear from this emerging literature is that the relationship between nutritional status and neurocognitive functioning at various stages of the lifespan is complex An aim of this

Research Topic is to bring together some recent empirical findings reviews and commentaries of the literature to date and opinion pieces relating to future directions for this burgeoning field
